Our Proposal

Our project is going to create an agentic system capable of managing the online portal of a university book store. This system will manage student return requests, handle limited amounts student records, and respond to emails and messages about these topics. Our team is divided into two groups, both a red team and a blue team, to coordinate the development and safety of our agent.

RED TEAM	BLUE TEAM
Dana	Parth
Noelle	Kavya
	Calianna

Architecture

This diagram demonstrates our different agents and their tasks, including 3 worker agents who

handle returns, records lookup,and reply drafting, and a orchestration agent which manages the previous 3. The orchestrator agent is also the most powerful of the agents, having the most database access and largest memory. Together, these 4 agents manage the university system and handle emails, returns, and records.
